Did You Know...

In January 1997 our N.A.T.A. approved lab placed a bare timber panel coated with 3 coats of Sun Master gloss on our roof exposure rack. By design exposure racks face due North and test panels are sloped at 45°, which has a multiplying effect on actual weathering so that one year approximates 1½ to 2 years on a wall.

*Sun Master after 10 years roof exposure (which equals 15 years wall exposure) and still going.

*3 coat alkyd system after 5 years roof exposure (note timber decay).

The alkyd based products were all from a major well known manufacturer.

*as at Jan 2007
